5.3 Data structures

Data is often stored in files, which consist of records, which in turn consist of fields, as illustrated in Figure 5.1.

For example, a company may have set up a file to include information about their employees in the following format:

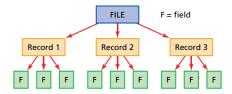

Figure 5.1 Structure of a data file

reference number/name/date started/department

Figure 5.2 shows a possible structure for the file COMPANY EMPLOYEE FILE. The information is held in one file with five records and four fields per record. In this example, the first field (the reference number) is known as the **key field** or **primary key**. Each primary key is unique and is used to locate a record in a file during a search operation.

| Record 1 | 1416 | J. Smith | 30/05/2003 | Sales | ↑ |
|----------|-------|--------------|------------|----------|--------------|
| Record 2 | 1417 | K. Shah | 11/02/1989 | Manager | |
| Record 3 | 1431 | R. Marques | 15/10/2001 | Finance | FILE |
| Record 4 | 1452 | T. Rodriguez | 27/09/1995 | Sales | |
| Record 5 | 1461 | V. Schultz | 09/12/2005 | Graduate | \downarrow |
| | field | field | field | field | , |

Figure 5.2 The file 'COMPANY EMPLOYEE FILE'

Also note the data types for each field:

reference number numeric data (integer)

name text

date date format (dd/mm/yyyy)

department text

In reality, COMPANY EMPLOYEE FILE would be much larger, containing all the records for all the company's employees. This type of file is often referred to as a **flat file structure**.
